

MMED 6005 - Fall 2017

Assignment #1 - Complete MVC Personnel Site (20%)

Complete the Employee Directory example built in class, adding to the basic site and writing code consistent with the OOP-based code written in class. You need to complete the following:

1. Implement the **search** form; both the form (as a separate view module) and the starting SQL statement for the Model have been provided. Implement the search in the appropriate place in the files of this basic site, consistent with the classes and methods already created. (HINT: Searches will always return lists, with 0, 1 or many records).
2. Complete the **employee detail view**, so that the links from the list display all details for a single employee. (Include the nav view so that you can click 'home' to return to the full list.)
3. Add the provided **images** to the existing views (thumbs on the list page, larger images in details), and add as much individual user content on the details view as you are able.
4. Add some **CSS** (in a separate CSS file) for a basic layout, text and link styling, and to style a basic unordered list of employees for Step 2. Also add styles to transform the nav view into a proper-looking horizontal menu. Style it up real nice-like.

DUE: Sunday October 29th by 11:59 PM. FOL Dropbox Submission.
